Inspection Fixture Conditions Dashboard Guide

The Inspection Fixtures Dashboard pulls together items of interest from all inspections recorded.

The top row shows the following totals (defined from left to right:

1. “Insp/Unit (summed) - Total inspections that require action items divided by Units where the inspection was logged.

In the example image below, 71 inspections with fixture action items were collected. The number is related to the “Inspections Per Unit” table (1st table on the lower left) which lists the Units ordered by the largest number of inspections at listed locations.

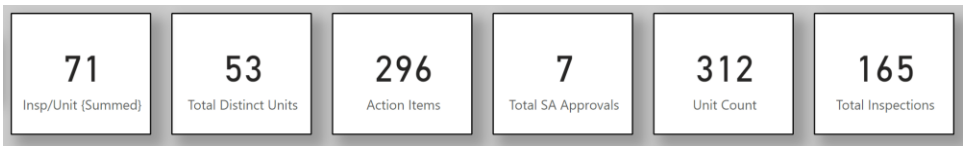
2. Total Distinct Units – Total number of Units with *at least one fixture action item*.

3. Action Items – All Action Items in the database. (Which can be filtered using a Relative Date tool.)

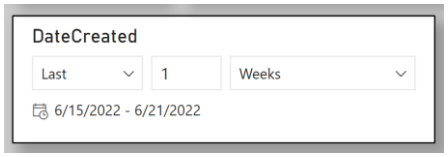
4. Total number of approved “Support Animal” records. Will show 0 if non-matching units are selected.

5. Total of all Units listed available for inspections.

6. Total number of Inspections. (Filtered using relative date tool.)



The Relative Date tool is used to view inspection fixture condition action item numbers by a definable number of past days, weeks, or months, which can help gauge the workload and projects that might need continuous monitoring.



Monitor larger expensive items for repairs or replacements:

To determine repeated repairs at a location, click on an action item, then a fixture type. If a specific location has a high count, then the repeated repairs or replacements can be viewed.

Another example of a use case:
When "New Paint" is required at a location, using the matrix hierarchy drill-down feature allows the user to view all rooms marked for that job. While the view is filtered and expanded, the list can be exported and printed easily.

All KPI's at the top are related to fixture conditions that were reported at a location. NOTE: there may be other inspection types that have no entries related to fixture conditions, like a Follow-Up inspection or the location was marked as "ALL GOOD" in every room, which accounts for higher inspection counts and lower Total Distinct Units counted.
